

Who is this For?

Although we originally created this product to prevent us from burning ourselves on gasless stoves and curling irons, we discovered that Too Hot To Handle is also great for:

- Families with Young Children
- The Visually Impaired
- The Elderly

TOO HOT TO HANDLE

How to Contact Us

Email:

amgrady@calpoly.edu

Mail:

165 Chorro St.
San Luis
Obispo, CA
93405

We are Cal Poly, San Luis Obispo graduates who wanted to create a device that promoted heat safety. Our product is currently available on Amazon and QVC but we are looking to expand into home hardware stores. Our hope is to prevent others from accidentally burning themselves and to also promote independent living for the elderly and visually impaired.

Our Product

Too Hot to Handle currently has one product, which shares their name. Their product, also called Too Hot to Handle, is a small tab which is placed on or near any object or surface that reaches a burning level of heat. This tab contains thermochromic technology which changes color to alert you when a nearby object is "too hot to handle". This tab also contains a bluetooth device that is connected to a separate motion sensor device that will beep if another object(hand) is coming near to something that is "too hot to handle". It combines the capability of both heat detectors and the portability of temperature indicating stickers.
